Field Guide 01 The Clinician's AI Safety Check

Before you open the tool, ask three questions.

If an answer needs action, do it before you go on.

1

1. Tool and task

Is this specific AI tool, account and intended use permitted by my organisation?

Yes → CONTINUE
No → STOP
Not sure → ASK FIRST

Yes

2

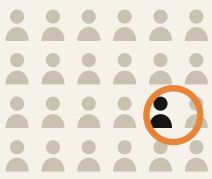

2. Information

Am I only using information permitted for this tool and workflow?

Yes → CONTINUE
No → CHANGE APPROACH or STOP
Not sure → ASK FIRST

Yes

3

3. Identifiability

Could these details, alone or together, identify a person?

No → CONTINUE
Yes or not sure → Pause and follow local guidance

No

All three checks clear?

Continue only if your organisation permits this tool, use and information, and verify outputs before relying on them. This never means "passed".

AI confidence is not evidence.

During

Check 4
Am I staying within permitted information boundaries, including attachments, screenshots and follow-up prompts?

Check 5
Am I keeping AI within its authorised supporting role and retaining human clinical judgement?

Check 6
If the task changes, AI asks for more data or a concern arises, should I stop and seek advice?

After

Check 7
Did AI invent, omit, distort or overstate anything clinically important compared with the source?

Check 8
Have I checked relevant facts, figures, medications, links, evidence and references against suitable sources?

Check 9
Has the output followed the right review route (one patient, or reused and shared), and storage and versioning rules?

If something goes wrong

STOP
Stop further disclosure, sharing or reliance.

REPORT
Use your organisation's approved incident channel, promptly.

RECORD
Facts, time, tool and account, possible exposure. Approved systems only.

CONTAIN
Follow instructions on access, retention, deletion and evidence. Deleting the chat doesn't undo it.

COOPERATE
Follow the response and any patient-safety actions.
